

OCCUPATIONAL RESPIRATORY DISEASES

By: Dr Chavoshi

- ◆ The respiratory tract is often the site of injury from occupational exposures
- ◆ The respiratory tract has a limited number of ways to respond to injury
- ◆ Acute : rhinosinusitis, laryngitis, ...
- ◆ Chronic : asthma, parenchymal fibrosis, ...

Evaluation of Patients

- ◆ Detailed history (occupational & environmental exposures, hobbies)
- ◆ Thorough physical exam (not specific, insensitive)
- ◆ Appropriate imaging studies
- ◆ Pulmonary function tests (spirometry, bronchoprovocative tests)

Types of Diseases

- ◆ Toxic inhalation injury
- ◆ Occupational asthma
- ◆ Hypersensitivity pneumonitis
- ◆ Inhalation fever
- ◆ Pneumoconioses
- ◆ Chronic bronchitis
- ◆ Pleural disorders
- ◆ Lung cancer

Toxic Inhalation Injury

- ◆ Short term exposure to high concentrations of noxious gases, fumes, mists
- ◆ Severity & site of injury depends on:
 - Water solubility
 - Concentration
 - Duration of exposure
 - Ventilation of victim

Treatment

- ◆ Decontamination
- ◆ O₂
- ◆ Bronchodilator
- ◆ Drainage
- ◆ No steroids unless the patient is not recovering promptly

Asthma

- ◆ Reversible, episodic airway obstruction (spontaneously or with treatment)
- ◆ Airway inflammation
- ◆ Increased airway responsiveness

- ◆ Occupational asthma is the most common occupational respiratory disorder

Work-related Asthma

- ◆ Occupational asthma (3%)
- ◆ Work-aggravated asthma
- ◆ Work-related asthma(15%)

Occupational Asthma

- ◆ Sensitizer-induced
 - long term exposure
 - specific responsiveness to an etiologic agent
- ◆ Irritant-induced (RADS)
 - a single intense exposure
 - persistent non-specific hyperresponsiveness

- ◆ Non-specific hyper-responsiveness is a very important characteristic of allergic & non-allergic induced asthma

Sensitizing Agents

- ◆ HMW agents (IgE-mediated)
e.g. animal & plant proteins
- ◆ LMW agents (IgE-mediated , unknown)
e.g. antibiotics , metals
acid anhydrides , diisocyanates

Non-sensitizing Agents

- ◆ Anticholinesterase effect
e.g. organophosphates
- ◆ Endotoxin effect
e.g. cotton dust
- ◆ Airway inflammation
e.g. acids, ammonia, chlorine
- ◆ Airway irritation
e.g. dusts, fumes, mists, vapors, cold

Sensitizer-induced Asthma

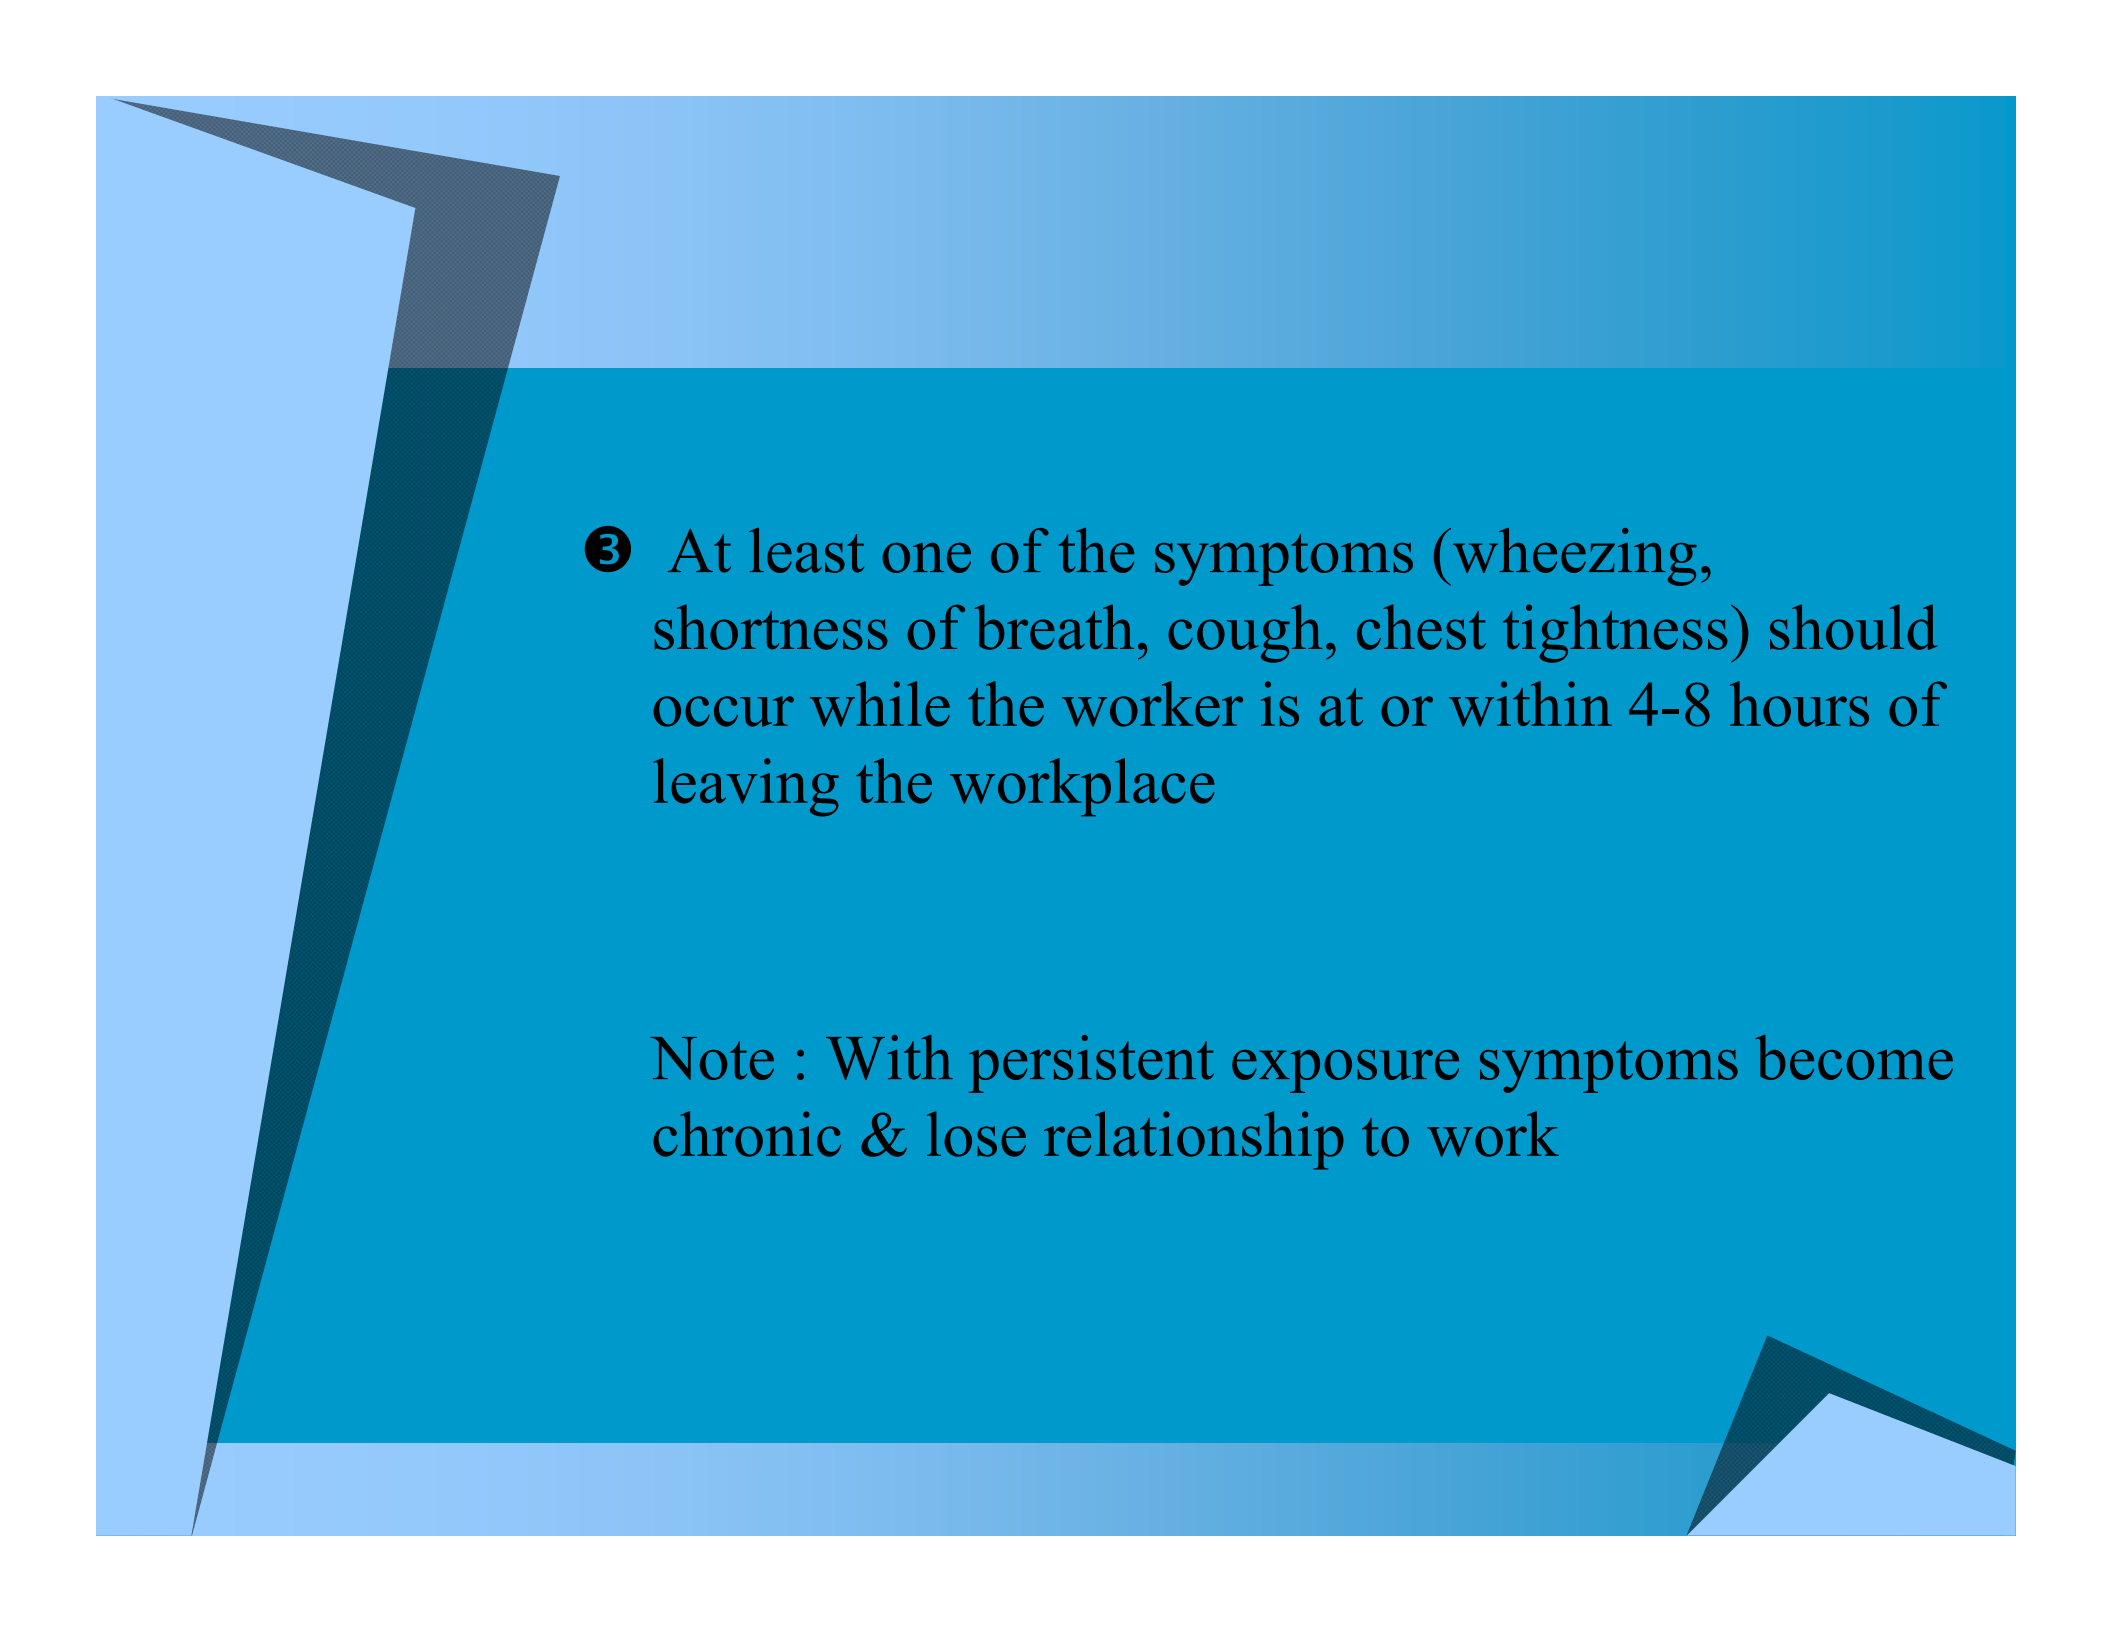

- ◆ Early response (HMW) (15-30 min)
- ◆ Late response (LMW) (4-8 hours later)
- ◆ Dual response (HMW)

Diagnosis

- ❶ Confirming the diagnosis of asthma
 - intermittent respiratory symptoms
 - evidence of reversible airway obstruction

② Relationship between asthma & the work environment

- symptoms occur only at work
- symptoms improve on weekends or vacations
- symptoms occur regularly after work shift
- symptoms progressively increase over the course of the work week
- symptoms improve after a change in the work environment

- 
- ③ At least one of the symptoms (wheezing, shortness of breath, cough, chest tightness) should occur while the worker is at or within 4-8 hours of leaving the workplace

Note : With persistent exposure symptoms become chronic & lose relationship to work

Spirometry

- ◆ The most reliable method
- ◆ May be normal between attacks
- ◆ After bronchodilator : 12% increase in FEV1 is significant (hyper- responsiveness)
- ◆ Across work shift : 10% fall in FEV1 is suggestive

PFM

- ◆ PEF is the best way
- ◆ 4 times/day + symptoms + medications
- ◆ $\geq 20\%$ diurnal variability is considered asthmatic response

Prevention

- ◆ In all work places where cases are diagnosed
- ◆ Removal from exposure
- ◆ Engineering controls
- ◆ Medical surveillance
- ◆ Education
- ◆ Smoking cessation program

Hypersensitivity Pneumonitis *Extrinsic Allergic Alveolitis*

- ◆ Immunologically-mediated inflammatory disease of lung parenchyma
- ◆ Induced by inhalation of organic dusts containig the etiologic agents

Causing Agents

- ◆ Bacteria (Thermoactinomycetes in moldy hay, grain, sugar cane,...)
- ◆ Fungi (Aspergillus in moldy malt, cheese,...)
- ◆ Amoeba (Acanthamoeba in contaminated water)
- ◆ Animal proteins (bird feathers, urine, droppings,...)
- ◆ Chemicals (toluene diisocyanate, TMA, ... in polyurethane foams, epoxy resins,...)

Pathogenesis

- ◆ Repeated inhalation exposure
- ◆ Sensitization of the individual
- ◆ Immunologically-mediated lung damage

Course

- ◆ Few exposed people develop it
- ◆ Complete resolution in early removal
- ◆ Progressive interstitial fibrosis in continued exposure

Acute HP

- ◆ More common
- ◆ 4-6 hours of an intense exposure
- ◆ Chills & fever
- ◆ Malaise & myalgia
- ◆ Dyspnea & cough
- ◆ Headache
- ◆ Bibasilar inspiratory crackles

LAB

- ◆ Diff. : Leukocytosis (increased neutrophils, decreased lymphocytes)
- ◆ ABG : hypoxemia
- ◆ CXR : bilateral reticulonodular pattern
- ◆ Spirometry : restrictive

Course

- ◆ Progresses 18-24 hours, then gradually resolves
- ◆ Recurrence occurs with re-exposure

Chronic HP

- ◆ Recurrent low-level exposure
- ◆ Insidious onset
- ◆ Chronic interstitial lung disease with fibrosis

Symptoms & Signs

- ◆ Dyspnea & cough
- ◆ Excessive fatigue
- ◆ Weight loss
- ◆ Cyanosis & clubbing
- ◆ Inspiratory crackles

CXR & Spirometry

- ◆ Diffuse linear markings
- ◆ Reduced lung size
- ◆ Spirometry : restrictive

Treatment

- ◆ Avoidance of exposure
- ◆ Respiratory protective equipment
- ◆ Corticosteroids (Prednisone 1mg/kg/day – 1 month) – follow with CXR & PFT
- ◆ Beta-agonists
- ◆ Oxygen

Inhalation Fever

- ◆ Exposure to polymer fumes, metal fumes, organic dusts (grain, cotton,...)
- ◆ High attack rate
- ◆ Most common cause : zinc oxide
- ◆ Chills, fever, myalgia, headache, malaise, cough, chest discomfort
- ◆ CXR, PFT, ABG : normal
- ◆ CBC : leukocytosis
- ◆ Treatment : symptomatic
- ◆ Complete resolution in 1-2 days
- ◆ No evidence for steroid therapy

Pneumoconioses

- ◆ Silicosis
- ◆ Asbestosis
- ◆ Coal workers' pneumoconiosis

Pneumoconiosis

- ◆ Literally means dust in lungs
- ◆ Not all dusts cause disease
- ◆ ILO : accumulation of dust in lungs and the tissue reaction to its presence

Benign Pneumoconiosis

- ◆ Inert dusts contain $< 1\%$ quartz
- ◆ Do not disrupt alveolar architecture or give rise to collagenous fibrosis
- ◆ No symptoms or functional abnormalities
- ◆ May be cleared from lungs over a period of time with avoidance of exposure
- ◆ e.g. iron, tin, antimony, barium

Collagenous Pneumoconiosis

- ◆ Dusts that stimulate a response in lungs and lead to irreversible fibrosis and structural alterations
- ◆ e.g. silicosis, asbestosis

Chronic Bronchitis

- ◆ Minerals (coal, silica, cement,...)
- ◆ Metals (vanadium, welding fumes,...)
- ◆ Organic dusts (cotton, grain,...)
- ◆ Smoke (tobacco, fire,...)
- ◆ Esp. in smokers
- ◆ Increased incidence among coworkers

Pleural Disorders

- ◆ Benign pleural effusions
- ◆ Pleural plaques
- ◆ Mesothelioma
- ◆ The primary cause is asbestos
- ◆ Not always accompanied by asbestosis

Lung Cancer

- ◆ Asbestos
- ◆ Arsenic
- ◆ Chloromethyl ethers
- ◆ Chromium (hexavalent)
- ◆ ETS (synergism)
- ◆ Mustard gas
- ◆ Nickel
- ◆ PAH
- ◆ Radon
- ◆ Silica
- ◆ Beryllium

◆ *GOOD LUCK*
